HYDRAULIC ROOF REMOVER

GRIZZLY'S hydraulic roof remover is loaded with innovations. This machine is fully hydraulic, no differentials or transfer cases. Two hydraulic motors drive the wheels and the blade is driven from a third hydraulic motor. It has a Honda GX340 engine.

This technology provides GRIZZLY with the advantage of controlling each of the wheels individually to allow forward, reverse and even turning, an industry first! The direct drive on the blade allows for stroke control going from 0 strokes per minute to about 400 strokes per minute. The operator now has control over this crucial part of the roof removing process knowing that light concrete and polystyrene will rip off at different settings, another industry first. Wide tires provide excellent traction and spread the weight.
